

1) Create a flowchart to check whether a number is positive.

Code:

```
import java.util.Scanner;
class Positive{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int num= sc.nextInt();
        if(num >=0){
            System.out.println("positive number");
        }
        else{
            System.out.println("Not a positive number");
        }
    }
}
```

2) Create a flowchart to check whether a number is negative.

Code:

```
import java.util.Scanner;
class Negative{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int num= sc.nextInt();
        if(num < 0){
            System.out.println("Negative number");
        }
        else{
            System.out.println("Not a negative number");
        }
    }
}
```

3) Create a flowchart to determine whether a number is odd or even.

Code:

```
import java.util.Scanner;
class EvenOdd{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int num= sc.nextInt();
        if(num % 2 ==0){
            System.out.println("Even number");
        }
        else{
            System.out.println("Odd number");
        }
    }
}
```

4) Create a flowchart to display a "Good Morning" message based on a given time

Code:

```
import java.util.Scanner;
class Message{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int time= sc.nextInt();
        if(time >= 5 && time <=12 ){
            System.out.println("Good Morning");
        }
        else{
            System.out.println("No Message");
        }
    }
}
```

5) Create a flowchart to calculate and print the area of a square

Code:

```
import java.util.Scanner;
class AreaOfSquare{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int side= sc.nextInt();
        int area = side * side;
        System.out.println("area of square :"+ area);
    }
}
```

6) Create a flowchart to calculate and print the area of a rectangle.

Code:

```
import java.util.Scanner;
class AreaOfRectangle{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int length= sc.nextInt();
        int width = sc.nextInt();
        int area = length * width;
        System.out.println("area of Rectangle :"+ area);
    }
}
```

7) Create a flowchart to find the largest of three numbers.

Code:

```
import java.util.Scanner;
class LargestNum{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the number: ");
        int num1= sc.nextInt();
        int num2 = sc.nextInt();
        int num3 = sc.nextInt();
        if(num1>num2 && num1 > num3){
            System.out.println("Largest number is : " +num1);
        }
        else if(num2 > num1 && num2 > num3){
            System.out.println("Largest number is : " +num2);
        }
        else{
            System.out.println("Largest number is : "+num3);
        }
    }
}
```
